Patent No. 6677731
GENERAL INFORMATION:
APPLICANT: OLEK, Alexander
APPLICANT: PIEPENBROCK, Christian
APPLICANT: BRENTIN, Kurt
APPLICANT: APPLICANTION: Diagnosis of Diseases Associated with DNA Replication
TITLE OF INVENTION: by Assessing DNA Methylation
                                                                                                                                                                                                                                                    3409 TTAAAATAATCTTCTAACTACAATAAACAACGACATTAACATCTAATACTCCAAAA

New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.

Claim 4; Page 65-66; 74pp; English.

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris exotic genotype 60271 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents the truncated P. vulgaris exotic genotype 602771 Arcelin-5 promoter sequence. This sequence is a deletion mutant of the Arcelin-5 promoter, created by the removal of approximately 600 base

             The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus wilgaris exotic genotype 602711 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-5 full length promoter sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Arcelin-5

The invention relates to heterologous gene expression in plants. The invention also relates to seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 51 % end. This expression cassette is useful for heterologous gene expression in plants. The protein encoded by the heterologous gene expression in plants. The protein encoded by the heterologous gene is a single chain antibody variable fragment (scrv). The present sequence is Phaseolue vulgaris arcelin promoter of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                Novel seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 51 3' end, useful for heterologous gene expression in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAAAAATTACACACAGAAACACAATAAACCCACTACGGTCAGGTTATCATAAGGATGA

```

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris exotic genotype 00271 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of diecary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important sequence represents a truncated P. vulgaris exotic genotype 602771 Arcelin-5 promoter sequence. This sequence was used in the expression of a GUS reporter gene in a soybean cotyledon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  548
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         667
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            727
                                                                          The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus wilgaris exotic genotype 06271 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-4 full length promoter sequence

Oulmassov Wang Q, Dubois P, Liang J,

WPI; 2002-508809/54.

New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or

Example 1; Fig 4; 74pp; English.

nutritional properties.

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseolus vulgaris exotic genotype G02771 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are RESULT 6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative dissorder haematopoietic cells; for differentiating between acute

                                                                                                                                                                          ď
lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/ors single nucleotide polymorphisms (SNPB) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, trearment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables ihighly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TATAATAATIGTAATTAGGTTTTTCTAGTCATGAGCACCACTCAGAGACAAGA

                                                                             ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulacory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated oped dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention. Oligonucleotides from the present invention. Oligonucleotides from the present invention. Oligonucleotides from the present invention on be used: for differentiating between acute disorder haematopoietic cells, for differentiating between acute disorder haematopoietic cells, for differentiation disorder determining the cytosine methylation state and/or single nucleotide coll proliferation disorder related sequences and their complements; and as primers for the cytosine methylatic cell proliferation disorder related sequences and their complements; and as primers for the sequences. The mucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between the amatopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3311 hahaarahahahahahanchaharrahahahahahahcarahahahahahahah 3252

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1202 TACAGTCATCGCAGTTCACAAGATAACAAGAAAACCAAGGGTAAGCTAATGAAAAAAAT 4261
                                                                                            The present invention relates to expression cassettes comprising a promoter sequence and a promoter polynucleotide with basal promoter activity, where the promoter sequence is operably linked to a heterologous polynucleotide, and when the expression cassette is inserted into a plant, the heterologous polynucleotide is specifically expressed in a suspensor cell and/or basal region of a plant embryo. The invention also provides polynucleotide sequences encoding Scarlet runner bean (Phaseolus coccineus) 6564 and 6341 proteins for use in the expression cassettes of the invention. The expression cassettes comprising promoters and promoter control elements are useful for modulating transcription of genes in a plant suspensor cell and/or basal region of a plant embryo. The present sequence represents Scarlet runner bean C541 genomic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1145 TACATOCTAAAGTOTTTOAGACCCTOTGACACATGT---ATCATOTOCOTOCTATATGTGA 4201

                                                                    The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseolus vulgaris exotic genotype 602711 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-5 promoter sequence fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pelet C;

contributed by Marian and a state of the present invention. Oligonucleotides from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoicitic cells and proliferative disorder haematopoicit cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoicitic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoicitic cell proliferation disorder related DNA equences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoicitic cell proliferative disorders. The present method enables a highly specific classification of haematopoicitic cell proliferative disorders. The present method enables chischly specific classification of haematopoicitic cell proliferative disorders allowing for improved and informed treatment of patients
dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118

Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent the distinguishes between methylated and non-methylated CpG dinucleotides.

Claim 28; SEQ ID NO 386; 117pp; English.

integratiating between heamatopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a terget mucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinuclectides within the terget nucleic acid. AB209861 to AB21818 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haemacopoietic cells and proliferative disorder haematopoietic cells, for differentiating between and acute myelogenous leukaemia; as probes for determining the dytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the cytosine methylation state and/or single nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, disgnosis, prognosis, treatment and/or monitoring of subclasses, disgnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferation disorder method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables thighly specific classification of haematopoietic cell proliferative disorders. The present method enables disorders allowing for improved and informed treatment of patients the present invention describes a method for detecting and

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid theukemia, Alzheimer's disease, Allo, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/hicerative bowel diseases. The present sequence is a gene of the invention

The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes bisulphite, of genes associated with tumour suppression and oncogenes complementary to (Ss). The nucleic acid may be a peptide nucleic acid complementary to (Ss). The nucleic acid may be a peptide nucleic acid oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single cucleotide polymorphisms and also to be used in an array for analysing diseases associated with Cpd dinucleotides e.g. cancers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters may be compared to another set of derived from tumour suppressor genes and oncogenes. Sequences of the numbered Seq ID numbered sequence is one of the 533 genomic sequences or numbered Seq ID numbered sequence (e.g. ID 2 and ID). ID 536 and ID corresponding odd numbered sequence (e.g. ID 2 and ID). ID 536 and ID corresponding odd numbered sequence is missing). Note: The sequence data for this patent did not form part of the printed sequence in the parameters of the printed sequence data for this patent did not form part of the printed sequence is missing the printed sequence is to be sequence of the sequence of the sequence data for this patent did not form part of the printed sequence is missing to the sequence is missing to the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of the sequence of

BMBO J. 5, 3075-3082 (1986)
See also «Kot660» for dlec1 gene (pseudogene).
Several inverted repeats are described in the 5' upstream region of the PHA coding region.
2 pot. glycosylation sites are found at the AA residues 33 and 92.
Pot. glycosylation sites are found (with respect to mRNA levels in normal cultivars); a 100bp deletion between pos. 501 and 502 (compared to dlec1, dlec2 and PdLec1) containing a large tandem repeat may be responsible for the low level of expression of Pdlec2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PLN 27-APR-1993

Phaseolus 1.

(Dasses 1 to 1768)

(Solker, T.A., Staswick, P. and Chrispeels, M.J.

Nolenlar analysis of two phytohemagglutinin genes and their expression in Phaseolus vulgaris cv. Pinto, a lectin-deficient cultivar of the bean

Lango J. 3.075-3082 (1986)

See also «X04659» for Pedec2 gene.

See also «X04659» for Pedec2 gene.

Several inverted repeats are described in the 5' upstream region of the PHA gene.

None of the 3 possible reading frames allow the translation of its message into a complete PHA polypeptide. The PHA translational start codon (pos. 708-710) starts a RP which codes for a truncated 50AA polypeptide with a N-terminal sequence completely identical to the dlec1 gene product, but is out of register after 10 codons due to a single bp deletion (pos. 739/740).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                        1 taggatccttcaatagaaaa......agagagtgatggttaatgca 1148

Patent No. 6607879
GENERAL INPORMATION:
COCKS, Benjamin G.
APPLICANT: Susan G. Stuart
APPLICANT: Susan G. Stuart
TITLE OF INVENTION: COMPOSITION FOR THE DETECTION OF BLOOD CELL GENE

Sanger Xenopus tropicalis EST project 2001
TROPICALIS SEQUENCE ID: TTPA076k17.plkSP6
Sequencing primer: $P6
This sequence is from a Xenopus Gene Collection (XGC) library
constructed by Nigel Garrett.
constructed by Nigel Garrett.
CONS. The Score of Towned from 5ug of poly A+ RNA from tadpole
embryos. BcoR1-NotI cut cDNA was then ligated into pCS107 with
ECORI at the 5' end and NotI at the 3' end.
Vector: pCS107; Sitel: ECORI; Site_2: NotI
HGST: Escherichia coll DH10B.

Distriction of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the co
genes). The size range of inserts for the library was 0.5Kb - 2.5 Kb, the cDNA being directionally cloned between the EcoRI and the KhoI sites of the Bluescript phagemid. Bluescript phagemid was excised by mass in vivo excision of the library and inserted into E coli XLI Blue. The plasmid was purified using the Giagen Giawell B system and sequenced with Tag dye-terminator chemistry (SK,T3 and T7 primers) for ABI 373A. The library was prepared by Hanan Abdel Ramed, Ain Shams Univ., Cairo and provided by Colino."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Rockville, MD. Genomic DNA isolated from a cloned population of
Rockville, MD. Genomic DNA isolated from a cloned population of
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shocgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Cxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hall, N., Bowman, S., Lennard, N.J., Doggett, J., Atkin, R., Chillingworth, C., Ormond, D., Harris, B., El-Sayed, N., Hou, L., Melville, S. E., Rajandream, M.A. and Barrell, B.G.

New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved distary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.

Claim 4; Page 65-66; 74pp; English.

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris exotic genotype 00271 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important sequence represents the truncated producing soybean plants that exhibit important sequence represents the truncated p. vulgaris excit genotype 002771 Arcelin-5 promoter sequence. This sequence is a deletion mutant of the Arcelin-5 promoter, created by the removal of approximately 600 base

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris exotic genotype 02071 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents a truncated P. vulgaris exotic genotype 60271 Arcelin-5 promoter sequence. This sequence was used in the expression of a GUS reporter gene in a soybean cotyledon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   122

The invention relates to heterologous gene expression in plants. The invention also relates to seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 513' end. This expression cassette is useful for heterologous gene expression in plants. The protein encoded by the heterologous gene is a slingle chain antibody variable fragment (scPv). The present sequence is Phaseolus vulgaris arcelin promoter of the invention
                                                                                                                                                                                                                                                                                              Novel seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 51 3' end, useful for heterologous gene expression in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            734 ACADARCABATTARGTTTCATTTGAGATTARGGAAGGTAAGGAAGAAGAAAAATTAAAA

                                                                                                                                                                                                                            The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris excitic genotype 602/71 Arcelin-5 promoter Sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-4 full length promoter sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          921
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseolus vulgaris exotic genotype G02771 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprisating the phaseolus vulgaris exctic genotype GQ2771 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New transformed or transgenic soybeans plants or cells with an Arcelin-5 product., for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.

                                                                                                                                                                                                                   The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseclus vulgaris exotic genotype 602/71 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-4 promoter sequence fragment
                                                                                                          New transformed or transgenic soybeans plants or cells with an Arcelin-5 proncter. for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or

RESULT 13

The present invention describes a substantially purified tocopherol protein (1). Also described is a method (M) for reducing expression of methyltransferase 1 (MTI) or gamma-tocopherol methyltransferase (GMT) in a plant, by transforming a plant with a nucleic acid molecule having an exogenous promoter region which functions in plant cells to cause the production of an mRNA molecule, and growing the transformed plant. (M) is useful for increasing the gamma-tocopherol content. A polyuncleotide (II) can be used for producing a plant having a seed with an increased alpha-tocopherol or alpha-tocortienol level. (II) is useful for increased alpha-tocopherol or alpha-tocortienol seed with an modulating the reduction of the expression, expression, overexpression of (1) in a transformed plant to provide tolerance to a variety of stress, cells of the expression at the expression of (II) is useful for obtaining other nucleic acid molecules or homologues from the same species, to screen cDNA or genomic libraries, to isolated promoters of cell enhanced, cell specific, tissue enhanced, tissue specific, developmentally or environmentally regulated expression profiles, as markers, for detecting single nucleotide polymorphism, and to determine the level of (I) in a plant or pattern of expression of (I) encoded in part or whole by (II). The present sequence represents a PCR primer for an arcent invariou Novel substantially purified tocopherol protein and nucleic acid encoding the same, useful for producing a plant having a seed with increased alpha Gamma-tocopherol methyltransferase; methyltransferase; tocopherol; alpha-tocorienel; stress; oxidative stress tolerance; oxygen; ozone; UV tolerance; ultra violet tolerance; cold tolerance; tuna tolerance; tuna tolerance; cold tolerance; tuna pathogen; microbial pathogen; plant; enzyme; PCR primer; ss. The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a cethod for proteins proteins from these polymucleotide sequences. The proteins are useful for identifying compounds that modulate their compounds that modulate expression of the polymucleotide sequences. Or compounds that modulate expression of the polymucleotide sequences compounds that modulate expression of the polymucleotide sequences compounds that modulate expression of the polymucleotide sequences compound diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID), autoimmune disorders (e.g. severe combined immunodeficiency (SCID), autoimmune disorders (e.g. multiple selerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis). The polymucleotide sequences of the invention are also useful in gene therapy. AAS62214-AAS62838

Human bone marrow expressed single exon probe SEQ ID NO: 5258

```
New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                            Human; microarray; single exon probe; gene expression; breast; disease;

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contacting the probes with a collection of detectably labelled mucleic acids derived from mRNA of human breast, and then measuring the label bound to each probes of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring cancearrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 400 BP; 89 A; 85 C; 94 G; 132 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukabe in myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
